

Anticipated Volume of D&D and Remediation Waste

Current estimates show that 2.2 million cubic yards of demolition debris/remediation wastes will be generated during D&D/remediation of the Portsmouth Gaseous Diffusion Plant. This is equivalent to:

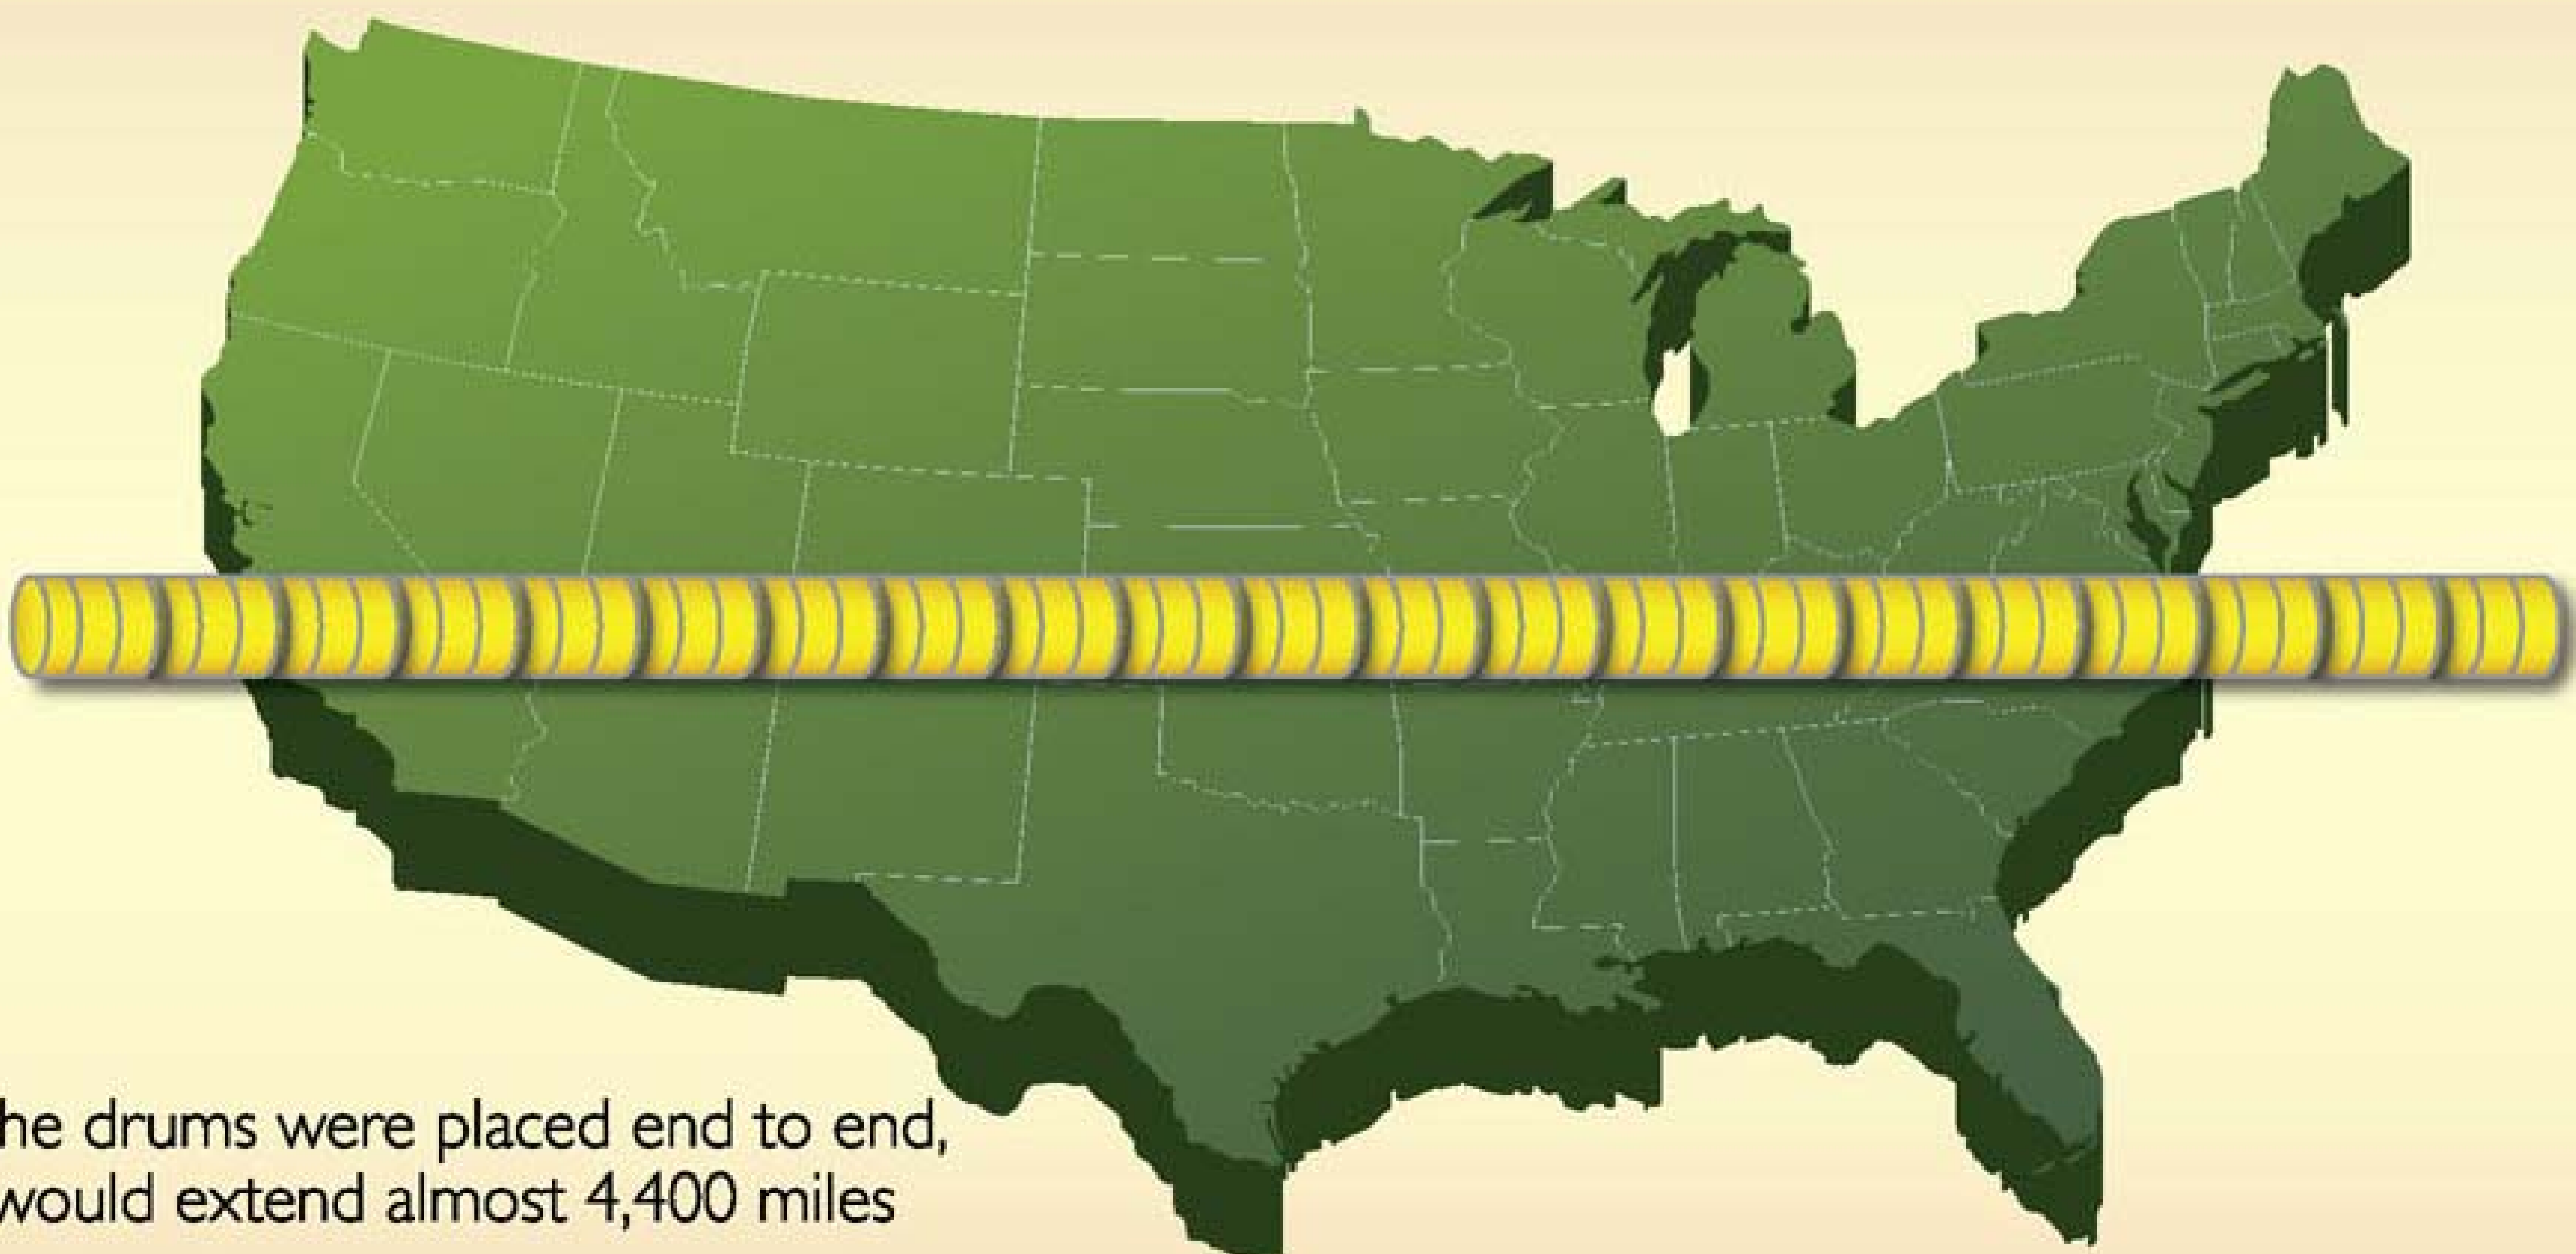

- 29,000 railcars (each 56 ft. long containing approximately 77 cubic yards) or
- 8,079,000 55 gallon drums or
- 367,000 standard dump trucks

A train with 29,000 railcars traveling at 50 mph would take six hours to pass a RR crossing

If all the debris were stacked on a football field, the pile would be 1,000 ft. high

If all the drums were placed end to end, they would extend almost 4,400 miles
